Adam Pluguez

Merced, CA | adapluguez@gmail.com | (209) 608-6998 | LinkedIn | github.com/adaPlu

PROFESSIONAL SUMMARY

Full-stack and AI software developer with experience building production-oriented web applications, real-time multiplayer systems, AI-assisted tools, Android applications, and browser automation pipelines. Holds a B.S. in Computer Science and Engineering from UC Merced and completed Java/Spring training at Infosys. Proficient across the full stack with a portfolio of original software spanning mobile, web, backend, AI integration, and embedded systems.

EXPERIENCE

Associate Software Developer January 2023 – June 2023
Infosys Limited *Sunnyvale, CA*

- Trained on Java, Advanced Java, MongoDB, and microservices; built real projects during structured training alongside coursework in debugging, testing, and maintainable object-oriented code.
- Worked in an Agile cohort with code reviews, technical documentation, issue investigation, and cross-functional collaboration.
- Applied software development lifecycle practices while building and troubleshooting backend-oriented service components.

EDUCATION

University of California, Merced
B.S. Computer Science and Engineering. Graduation Honors. *May 2021*
Relevant Coursework: Algorithms, Data Structures, Databases, Object-Oriented Programming, Computer Vision, Artificial Intelligence, Robotics, Networking, Probability/Statistics, Linear Algebra

Las Positas College
CompTIA A+ Certification / Windows Network Administration Training. *2006*

PROJECTS

Quiz Royale Showdown https://github.com/adaPlu/quiz-royale-showdown 2026 – Present
Original Public Repository

- Built a real-time multiplayer quiz platform spanning an Android client, TypeScript backend, React/Vite web app, load-testing tools, and deployment configuration; deployed via Cloudflare with up to 15 concurrent testers during closed testing. Tech: TypeScript, Node.js, Express, React/Vite, Android, Socket.IO, PostgreSQL, Redis, Docker.
- Implemented REST and Socket.IO communication for authentication, rooms, game state, timed rounds, answer submission, scoring, rankings, XP updates, and end-of-game events.
- Verified a full 10-round multiplayer loop including score accuracy and XP persistence for participating players.
- Added API and authentication-specific rate limiting; hardened validation, reliability, and staging deployment.
- Used PostgreSQL and Redis for durable/shared state, Docker for local infrastructure, Railway for backend services, and Cloudflare for the web experience.

Reseller All-in-One https://github.com/adaPlu/ResellerAllInOne 2026 – 2026
Private Maintained Repository

- Maintained and hardened a mobile-first AI product-sourcing assistant combining Gemini-based product identification, marketplace comparisons, condition-aware pricing, saved scans, and spoken HIT/MISS recommendations. Tech: React 19, TanStack Start, TypeScript, Node.js 22, Express 5, Gemini, SQLite, Docker.
- Worked with camera- and description-based Gemini product identification, Gemini TTS, eBay Browse API data, Bright Data and SerpAPI fallbacks, and condition-aware pricing rules.
- Implemented remediation around request-size limits, shared rate limits, provider concurrency controls, cache-key normalization, retry budgets, and API-key transport.
- Used automated tests for FLIP/SKIP thresholds, pricing filters, cache collisions, wrong-product protection, eBay auth/retries/circuit breaking, and estimate labeling.
- Prepared Docker, Fly.io, and Render deployment paths with persistent SQLite volumes and a production health endpoint.

AI Reseller Suite / Vinted Listing Automation 2026 – 2026
https://github.com/adaPlu/Vinted-Listing-Automation
Original Public Repository

- Built an AI-assisted resale workflow that converts item photographs into marketplace-ready Vinted drafts while preserving a human approval gate before publication. Tech: Python, Playwright, Chrome CDP, Pillow, OpenCV, rembg, ONNX Runtime.
- Created a photo-to-draft pipeline covering image ingestion, background removal, enhancement, listing generation, category selection, pricing adjustment, browser automation, and human review.
- Used Playwright with a persistent Chrome profile and Chrome DevTools Protocol to automate an authenticated marketplace workflow without embedding credentials in code.
- Combined Pillow, OpenCV, rembg, and ONNX Runtime for image normalization and subject/background processing.

ClickDungeon https://github.com/adaPlu/ClickDungeon 2025 – 2026

Original Private Repository

- Developed a commercial-minded Android roguelite with a 5x5 hidden-tile dungeon, 99-floor campaign, class progression, turn-based combat, persistent inventory, achievements, and launch-readiness tooling. Tech: Java, Android SDK, Gson, SharedPreferences, RecyclerView, Robolectric.
- Implemented persistent gold, inventory, equipment, achievements, four save slots, corruption handling, checksums, backup recovery, and encrypted preferences using Android Keystore/Tink.
- Maintained Robolectric/unit coverage for settings, inventory, shop, achievements, save slots, security helpers, combat, abilities, terrain, balance, and persistence behavior.
- Reached a verified state where the debug APK, unit tests, and lint checks were green; remaining work targets store assets, Play Console, and Firebase provisioning.

YouTube Title and Description Generator 2025 – 2025

https://github.com/adaPlu/Youtube-Title-Description-Generator

Original Public Repository

- Built a multi-interface AI content tool that generates SEO-oriented YouTube titles, descriptions, and tags and applies metadata through the YouTube Data API. Tech: Python, OpenAI API, YouTube Data API, OAuth 2.0, Tkinter, Flask, Fernet.
- Built CLI and Tkinter GUI workflows for LLM-based metadata generation and OAuth-authenticated YouTube video updates.
- Protected local OpenAI and Google OAuth configuration with Fernet encryption; added runtime logging, API error handling, and retry behavior for rate-limited requests.

LoopLine Courier 2026 – Present

Original Private Repository

- Developing a logistics puzzle game where each drawn route becomes a repeating time loop; built on a deterministic integer simulation so loop interactions are consistent and replayable. Tech: Unity 6, C#.

SKILLS

Languages: Java, Python, TypeScript, JavaScript, C, C++, SQL, HTML, CSS, Kotlin (working exposure), Go (working exposure), C# (working exposure), Swift (working exposure)

AI and Automation: LLM/API integration, Gemini vision and text-to-speech, OpenAI API, human-in-the-loop workflows, Playwright/Chrome CDP automation, image-processing pipelines

Web and Backend: Node.js, Express, React, TanStack Start/Router, Vite, Flask, Spring/Spring Boot, REST APIs, Socket.IO, authentication, rate limiting, SSR

Mobile and Desktop: Android SDK, Android Studio, SharedPreferences, Gson, RecyclerView, Robolectric, PyQt6, Tkinter, Chrome extensions

Data and Infrastructure: PostgreSQL, Redis, MongoDB, SQLite, Docker, Railway, Vercel, Fly.io, Render, AWS Lambda/API Gateway, Raspberry Pi/Linux

Quality and Security: Unit testing, integration testing, regression testing, load testing, encrypted local state, API-key hygiene, retries and circuit breakers
